                                                                                            ΩŽ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence encodes the Staphylococcus aureus signal recognition particle (SRP) fih component. Fih polynucleotides are useful for diagnosing a disease related to expression of fih polypeptides by analysing for the presence/amount of fih protein in a sample due to infection of a micro-organism with the gene, or determining the nucleic acid sequence encoding fih. Fih polypeptides and antaqonists are useful for treatment of an individual in need (polypeptide) of, or needing to inhibit (antagonist) fih polypeptide levels. Fih polypeptides and polypeptides and polypucleotides are useful for identifying aqonists and antagonists by binding and observing the affect of fih polypeptides and antagonists by contential anti-microbial agents. Fih polypeptides and antigenic fragments are also useful for inducing an immunological response (T cell/antibody) to protect against disease, by direct administration (vaccine), or via a vector (gene therapy). Anti-fih antibodies are useful as antagonists, and for protecting against disease. Diseases diagnosed, prevented and treated include those caused by infection, especially bacterial infection, infection and septic arthritis. Fif polypeptides are antimicrobial, and are useful for bathing wounds and implants prior to surgical
                                                                                                                                                                                                                                                                                                                          New Staphylococcus aureus Signal Recognition Particle (SRP) with protein (ffh) and RNA (ffs) components - the SRP gene and protein useful as diagnostic reagents and for prevention and treatment of Staphylococci infections which cause otitis media, septic arthritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Page 28; 35pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella promunoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodise capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Bnterococus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, themselves and the encoded proteins. The prokaryotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella promunoniae, Pseudomonas aesuvignosa and Enterococcus faecalis. The prokaryotis used in prolification of potential new targets invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to clamitify proteins used in prolification, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part contraction in the contraction and the printed specification, but was obtained in electronic forms directly from MIPPO at the contraction and the contraction and the contraction and the contraction are contractined in electronic forms directly from MIPPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

The present invention relates to nucleic acid sequences (ABO67188-ABO71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (portential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in anti-Listeria vaccines.

Note: The sequence data for this patent did not form part dit ne printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ProThrValValMetMetValGlyLeuGlnGlyAlaGlyLysThrThrAlaGlyLys 120

```

```
The present invention relates to nucleic acid sequences (ABQ67188-ABQ71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 187984 GGGAAAGTAAACGAAGCTGACGTAAAAGAAATGATGCGTGAAGTTCGTCTTGCTTTACTA 188043

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABPS124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to inteffere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

W.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid encoding a Staphylococcus epidermidis polypeptide, useful for diagnosing and treating bacterial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential cannot be themselves and the encoded proteins. The prokaryotes used are schemically staphylococcus aureus, Salmonella typhi, Klebsiella promuoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The prokaryotic development. The antisense nucleic acids can also be used to antibiotic development. The antisense nucleic acids can also be used to chantify proteins used in proliferation, to express these proteins, and to obtain antibodise capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella premomentae, Pseudomonas aeruginosa and Enterococcus facealls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Sesential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic

```

A computer readable medium has been developed which has recorded on it. 982 nucleotide sequences isolated from the Enterococcus facetlis genome. AAXI2938 to AAXI3919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based 1321 GATCAAATGCTAGGTGGCGGCGTTAAAGGCAAGTTAGGTAAAATG---GCCATGAATCGT 1377 420 New isolated Enterococcus faecalis polynucleotides and polypeptides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus GlnSerMetThrProAlaGluArgAsnAsnProAspThrLeuAsnValSerArgLysLys 401 ArgileAlaLysGlySerGlyArgSerLeuGlnGluValAsnArgLeuMetLysGlnPhe 1201 AGAATTGCAGCTGGTTCAGGAAATAGTGTGGTTGAAGTCAATCGTATGATTAAACAATTT 421 AsnaspMetLysLysMetMetLysGlnPheThr-----------------Enterococcus faecalis, contig, detection, Enterococcal infection, vaccine; attenuation; computer readable medium; ds. system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the can be used to approperlides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal infection.

Claim 4; SEQ ID NO 1847; 200pp; English.

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genomic sequenced tags (GST), examining the array, and determining relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cell relative to expression of the same genes in one or more second Bacillus cells. The method is useful for monitoring of Johal expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions, in which Bacillus cells adapt to changes in culture conditions. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO environmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information available. This sequence represents a genomic sequence tag (GST) used the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   conding polypeptides (AAMO1102-CAMO1114), which are essential for the viability of a bacterial cell wall. The acronym CFE stands for "CDG For Expression", where CEG stands for "Conserved Essential Gor "CDG For acids are useful for detecting the presence of proteins essential for the nucleic acids are useful for detecting the presence of proteins essential for the biological fluids, blood, serum, nose, ear or throat swabs with ligands, and for detecting corresponding target nucleic acid molecules with complementary sequences. The nucleic acids are also useful for determining whether a genomic nucleotide sequence of interest is essential for viability of a bacterial cell or whether it resides within an operon, by integrating an exogeneous nucleotide sequence comprising a portion of an open reading frame of the genomic sequence of interest corrising 200-500 base pairs) into the genomic sequence of interest which confers a selectable phenotype to the cell, and determining cell corresponding and proteins are also useful as vaccines and for treating bacterial infections with gene therapy and antisense therapy. The nucleic acids and proteins are also useful as vaccines and for treating bacterial infections with gene therapy and antisense therapy. The nucleic acids antibiotic resistant bacterial infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are scherichia coli, staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

The present sequence encodes an essential prokaryotic cellular proliferation protein.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen
